

WAITER ROBOT + ANIVATAR AVATAR

Delivers dishes. Talks to guests.

Physical support for service and a digital conversation partner. The robot transports items. Anivatar gives it a face, a voice, knowledge and personality.

Application visualisations. The robot's appearance depends on the selected model.

More than a transport robot.

We combine a waiter robot with an interactive avatar. The physical platform supports transport around the dining area. The Anivatar character holds live conversations rather than playing a prerecorded video. It uses prepared knowledge and the venue's rules.

01

Support for the team

Transports dishes and tableware along designated routes. The robot supports staff without replacing their relationships with guests.

02

A conversation about the menu

Explains the offer, presents daily specials and shares approved information. Matters requiring a person are passed to the team.

03

The venue's personality

Voice, expressions and conversational style tailored to the brand. Languages and character personality are chosen for the audience.

A digital host

Welcomes guests, explains and helps them find information.

Technology with a face

Interaction that goes beyond screens and buttons.

Start with a pilot in your venue.

We assess routes, the team's tasks and conversations with guests. Features, languages, integrations and operating conditions are selected for the robot model and venue. Ingredient and allergen information must be approved by staff.

Book a demonstration. Let's explore the possibilities.
